The AACN Synergy Model for Patient Care Cram101

The Future of Nursing explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in number, nurses make up the single largest segment of the health care work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who pursue

doctorates. Furthermore, regulatory and institutional obstacles -- including limits on nurses' scope of practice -- should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing.

It is now widely recognized that the physical environment has an impact on the physiology, psychology, and sociology of those who experience it. When designing a critical care unit, the demands on the architect or designer working together with the interdisciplinary team of clinicians are highly specialized. Good design can have a hugely positive impact in terms of the recovery of patients and their hospital experience as a whole. Good design can also contribute to productivity and quality of the work experience for the staff. 'Design for Critical Care' presents a thorough and insightful guide to the very best practice in intensive care design, focusing on design that has been successful and beneficial to both hospital staff and hospital patients. By making the connection between research evidence and design practice, Hamilton and Shepley present an holistic approach that outlines the future for successful design for critical care settings.

Critical Care Nursing: Learning from Practice takes a unique approach to critical care. Based around case scenarios that have the patient as the central focus, each chapter is constructed around an example of a critically ill patient with specific care needs. The chapters then go on to critically explore the knowledge and skills required to deliver expert care. This book looks at a range of critical care scenarios, including: The patient with acute lung injury The patient with fever The patient with an acute kidney injury The patient with long term needs The patient with increased intra-abdominal pressure The Patient following cardiac surgery Each chapter develops knowledge of the related physiology/pathophysiology, appropriate nursing interventions that are research/evidence based, technical skills, data interpretation and critical appraisal skills, enabling the reader to apply fundamental knowledge to more complex patient problems. Critical Care Nursing: Learning from Practice is an essential resource for practitioners faced with complex and challenging patient cases.

Advanced Practice in Critical Care provides experienced critical care nurses with a clear and distinct evidence base for contemporary critical care practice. Central to the book is the application of research and evidence to practice and therefore, case studies and key critical care clinical situations are used throughout to guide the reader through the patient care trajectory. Each chapter introduces an initial patient scenario and as the chapter progresses, the patient scenario develops with theoretical perspectives and application. In this way, it is evident how multi-organ dysfunction develops, impacting upon and influencing other body systems, demonstrating the multi-organ impact that is often experienced by the critically ill patient. In this way, consequences of critical illness such as acute renal failure, haemostatic failure and liver dysfunction are explored. Throughout the text, key research findings and critical care treatment strategies are referred to, applied and evaluated in the context of the given patient case study. Advanced assessment techniques are explained and the underlying pathophysiology is discussed in depth. Advanced Practice in Critical Care is an essential resource for experienced practitioners within critical care whom primarily care for patients requiring high dependency intensive care.

This book provides essential insights into how the approach to nursing care in ICU patients has markedly changed over recent years. It shows how the focus has progressively moved away from the technical approach that characterized early ICUs to a wider personalization of patient care that also highlights general problems such as basic hygiene and general comfort. It also demonstrates that, at the same time, the nurses' role has become more professionalized, with increasing competences in assessing and managing patients' problems and measuring related outcomes. It is structured in four units: Unit 1 presents the essential elements of accurate vital-function and basic-needs assessments for ICU patients, using both instrumental monitoring and specially validated assessment tools. Unit 2 addresses basic care in ICU patients, particularly hygiene and mobilization, reflecting recent developments in nursing that focus on the importance of these activities. Unit 3 highlights the main nursing outcomes in ICU patients, particularly focusing on risk prevention and complication management. Lastly, Unit 4 discusses advances in ICU nursing, from clinical, organizational and research perspectives.

Critical Care Nursing: A Holistic Approach Oxford University Press

This book is organized into five parts, the first two of which cover areas applicable to all critical care patients, including the patient's and family's experience, education, pain management, ethical and legal issues, and the rewards and challenges of critical care nursing. The third part addresses specific populations, including pediatric patients, pregnant women, older adults, and postanesthesia patients, as well as interfacility transport. The balance of the book is arranged by body systems and concludes with multisystem problems. This is the seventh edition of a text first published in 1973 and last published in 1994. The purpose is to present current, comprehensive, and practical information built on a holistic perspective of care in which the patient is the core of nursing practice. This book meets a need for educating students and nurses in the critical care environment. The editors' objective of providing a framework for focusing on patient responses in the critical care environment is met. This book is intended for students in critical care, educators, and clinicians. This edition is also tailored to meet the needs of patients. The editors are excellent authorities in critical care nursing. All three are practitioners, and one is both practitioner and educator. The contributors and reviewers are critical care experts. The illustrations are used best to understand critical care technology. The graphics used for anatomy, physiology, and patient assessment add to the usefulness of the text. The references are pertinent and current, but certain specialty content would need to be updated by the reader (e.g., medication protocols for CHF). The use of color in the text is managed carefully to guide and not overpower the reader. The 1997 ACLS Guidelines are in Appendix 1. The Answer Key to Study Questions appears in Appendix 2. Anatomy and physiology, patient assessment and clinical management, nursing research, collaborative plans of care, teaching, and home care issues are some of the innovations presented. One strength of book is how it addresses the changes associated with aging and the needs of the older adult. Aging concerns are covered in one chapter and are highlighted throughout the text. This edition provides current information that makes the previous edition out of date. I would recommend this text for beginning critical care nurses and for undergraduate nursing students for its coverage of advanced pathophysiological concepts.
