called Lie theory, originated in the study of natural symmetries of solutions of differential equations. However, unlike say the nice collection of symmetries of the hexagon, these symmetries occurred in continuous families, just as the rotational symmetries. Lie groups, Lie algebras, and their representations are Lie algebras and their representations described. In Chapter II we apply the theory of Lie algebras to the study of algebraic groups in characteristic zero. As Cartier (1956) noted, the relation between Lie algebras and algebraic groups in characteristic zero is best understood through their categories of representations.
